Mission: Providing Sovereign Health Infrastructure for Power-Unstable Environments.

The Problem: Clinical Blindness & Liability

Handwritten, paper-based prescription systems in Bangladesh create "Clinical Blindness"—a state where doctors lack access to verified patient medical history, leading to lethal medication errors.

- **Lethal Risk:** Approximately 56% to 60% of cardiac care prescriptions contain at least one potential drug-drug interaction (DDI).
- **Systemic Failure:** 96.7% of history gaps in district hospitals force expensive, redundant diagnostic re-testing.
- **Legal Liability:** Regulatory bodies (DNCRP) are actively fining pharmacies and clinics for misinterpreting illegible scripts.

The Solution: An AI-Powered National eRx Grid

IntelliScript BD is an offline-resilient, FHIR-compliant cryptographic network designed to eliminate prescription fraud and prevent fatal interactions.

- **100% Offline Persistence:** Engineered to survive 6-hour load-shedding windows on legacy hospital hardware without cloud reliance.
- **AI Sentinel Override:** An active interception engine that cross-references the "Sovereign Health Profile" to block lethal DDIs in real-time.
- **Cryptographic Certainty:** Prescriptions are secured with SHA-256 hashes and QR codes for tamper-proof pharmacy verification.

Market Validation (N=22): Primary field research across district Sadar hospitals confirmed:

- 100% Extreme Concern regarding counterfeit or expired medications.
- 86.4% Risk Awareness regarding "Blind Allergies" during ER admissions.
- 100% Demand for reliable, offline digital medical infrastructure.

Business Model & Scalability

Our strategy focuses on a low-friction B2B model. By utilizing existing legacy hardware, we achieve a near-zero Customer Acquisition Cost (CAC). Revenue is driven by API Licensing for pharmaceutical giants and private hospital networks seeking drug authenticity verification and liability protection.

The Ask

We are seeking seed capital and institutional backing to transition from our functional prototype to a 2,000-patient "Live Beta" pilot program within a targeted district hospital ecosystem.
